

A PROJECT

ON

DIGITAL SURFACE MODELING

(A CASE STUDY OF PART OF KWARA STATE POLYTECHNIC)

BY

ILESANMI ESTHER OLUWASEUN

HND/23/SGI/FT/055

**SUBMITTED IN PARTIAL FULFILMENT OF THE REQUIREMENTS
OF THE AWARD OF HIGHER NATIONAL DIPLOMAL (HND) IN
SURVEYING AND GEO-INFORMATICS TO THE DEPARTMENT OF
SURVEYING AND GEO-INFOMATICS,
KWARA STATE POLYTECHNIC, ILORIN KWARA STATE.**

JUNE, 2025.

CERTIFICATE

I hereby certified that all the information given in this project were obtained as a result of observations and measurements made by me and that the survey was carried out in accordance with Survey Rules, Regulations and Departmental instructions.

NAME: ILESANMI ESTHER OLUWASEUN

MATRICNO.:HND/23/SGI/FT/055

SIGNATURE:

DATE OF COMPLETION:

CERTIFICATION

This is to certify that **ILESANMI ESTHER OLUWASEUN** with matriculation number **HND/23/SGI/FT/055** has satisfactorily carried out this project under our instructions and direct supervision.

DEDICATION

I dedicate this project to Almighty God, whose guidance, strength, and blessings have been my constant source of inspiration and perseverance.

ACKNOWLEDGEMENTS

All adoration be to God Almighty, the gracious one who has given me the opportunity to complete my HND program in Surveying and Geo Informatics. My appreciation goes to my supervisor **MR.ABIMBOLA.I.ISAU** for his encouragement and motivation as regards the project thank you and God bless you sir.

To all my lecturers in the department of Surveying and Geo Informatics,

SURV. R.O ASONIBARE, SURV. A.G AREMU, SURV. R.S AWOLEYE, SURV. A.O AKINYEDE, SURV. AYUBA ABDULSALAM, SURV. F.D DIRAN AND SURV.BABATUNDE KABIR, may God bless you all (Amen).

I also express my sincere gratitude to my wonderful parents **MRS. ILESANMI REBECCA** their parental care and support since the inception of my educational career, they stood by me when things were tough and rough for me, they gave me hope, I will forever be grateful for the motivation you always gave to me at all time, if I would have to have parents in my life again, I will pray to have people like you around me again and to all my brothers and sisters **ILESANMI SEYI, ILESANMI MIRACLE.**

To all my understanding friends and lovers, I so much appreciate your support and advice thanks so much, May almighty God bless you all (Amen).

ABSTRACT

This project focuses on generating a Digital Surface Model (DSM) for part of Kwara State Polytechnic, located in Moro Local Government Area, Kwara State, Nigeria. To achieve this, a reconnaissance survey was conducted, and spatial data were collected using a Total Station, while non-spatial data were gathered through social surveys, including oral interviews and observations. The collected data were processed and analyzed using various software tools, including ArcGIS 10.1 for geospatial analysis and database design, AutoCAD 2007 for graphical representation, and Surfer 10 for contour generation and Digital Terrain Modeling (DTM). The project resulted in the creation of a comprehensive database that supports spatial search and decision-making processes. The outcome of this project is a topographic dataset in digital format, which can be utilized for various applications. A detailed technical report documenting the project's methodology, findings, and results has also been prepared.

CHAPTER ONE

1.0 INTRODUCTION

1.1 Background to the Study

The surface of the land is an important resource which human activities are continually modifying. Land is the earth's surface, both land and water, plus natural resources in their original state, such as: mineral deposit, wildlife, fish, timber, etc. Particular areas of land can be utilized by humans in diverse ways. These can include residential, institutional, business, industrial, agricultural, forestry, park, and other relatively natural land uses. In order to create a sustainable and favorable living, it is essential to protect our property or investment, in which land surveying helps in the positioning of objects in space and time as well as the positioning and monitoring of physical features, structures and engineering works on, above or below the surface of the earth and the analysis, interpretation and integration of spatial objects and phenomena in GIS, including the visualization and communication of such data in maps, models and mobile digital devices.

A Digital Elevation Model (DEM) is a digital representation of ground surface, topography or terrain. A DEM can be represented as a raster (a grid of squares) or as a triangular irregular network. DEMs are commonly built using remote sensing techniques; however, they may also be built from land surveying. DEMs are used often in geographic information systems, and are the most common basis for digitally-produced relief maps.

A Digital Surface Model (DSM) is a representation of any surface by using three dimensional (3D) coordinates, normally X, Y, Z Cartesian coordinates. The surface might be part of a small object, for example a vase, or it may be a very large object such as the surface of the Earth. When related to the Earth's surface, these coordinates are often converted into Easting, Northing and Height (E, N and H). A Digital Elevation Model (DEM) specifically relates to elevation and therefore height, and so will be defined as a

DSM of the Earth's surface. It is used generically to define both the ground surface, also called a Digital Terrain Model (DTM), and the ground surface plus the tops of features above the ground surface such as artificial structures and vegetation. The DSM is therefore the first surface that many airborne and spaceborne sensors will interact with. A DTM is normally created by stripping off all above ground surface features from the DSM to reveal a bald-earth Model.

Digital Elevation Model (DEM) represents a very important geospatial data type in the analysis and modelling of different hydrological and ecological phenomenon which are required in preserving our immediate environment. DEMs are typically used to represent terrain relief. DEMs are particularly relevant for many applications such as lake and water volumes estimation, soil erosion volumes calculations, flood estimate, quantification of earth materials to be moved for channels, roads, dams, embankment etc.

There are known methods by which DSMs can be constructed. Such methods include but not limited to digitizing existing topographic maps or by using stereoscopic aerial photographs, with the advance of digital photogrammetry.

Maune (2001) stated that Surface modelling is essential for various applications; orthophoto productions, engineering design, floodplain mapping, telecommunication, etc. all require surface data with different level of detail and accuracy.

1.2 Statement of the Problem

Topographic map of the School Kwara State Polytechnic is not up-to-date and heights of features were not represented. The production of Digital Surface Model will solve the following problems.

- i. Lack of current maps for the school's management use.
- ii. Lack of information about the height of details within the school.

1.3 Aim of the Project

The aim of the project is to produce a digital surface model of part of Kwara State Polytechnic, Ilorin Kwara State.

1.4 Objectives of the Study

In achieving the above stated aim, the following operations were carried out:

- i. Database Design for the study area
- ii. Data Acquisition, using Ground survey method (Total Station)
 - a) Geometric (Locational) Data Acquisition (X, Y, and Z).
 - b) Attribute Data Acquisition (Features description).
- iii. Creation of Database for Spatial entities in the study area.
- iv. Spatial Analysis.
- v. Information Presentation and Management.

1.5 Significance of the Study

The significance of this project are to, as stated below;

- i. Easy planning of any meaningful development.
- ii. Provide up-to-date Digital Survey Model for the School.
- iii. Provision of useful spatial analysis of information about any object for viable decision making and deformation studies.
- iv. For map revision purposes i.e. easy retrieval and updating of the database, and
- v. To get student acquainted with the knowledge needed for future environmental occurrences.

1.6 Scope of the Project

The scope of the project covers the following:

- i. Review of previous projects, literatures, journals, reports and text books.
- ii. Project Planning.
- iii. Database Design techniques.

- iv. DataAcquisition for perimetertraversing,detailing and spotheighting using automated Survey equipment.
- v. Data processing, spatial analyses and information presentation.

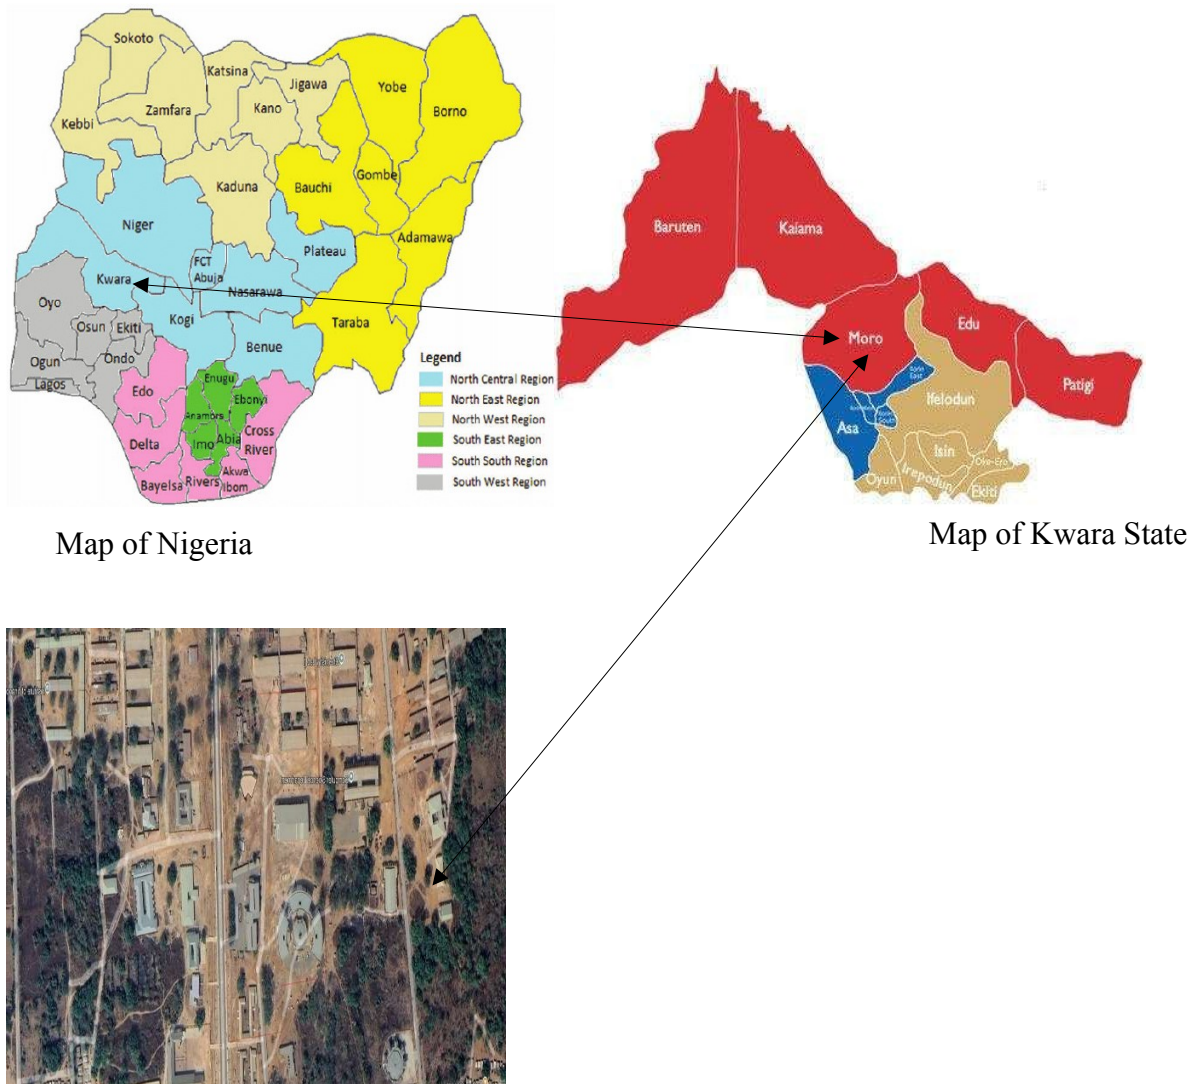

1.7 Personnel

The following are the personnel involved in executing the project:

| S/N | NAMES | MATRIC/NO | POSITION |
|------------|------------------------|-------------------|-----------------|
| 1 | ILESANMI ESTHER O. | HND/23/SGI/FT/055 | Author |
| 2 | TIAMIYU ZAINAB OLAITAN | HND/23/SGI/FT/056 | Member |
| 3 | BABALOLA OLUWATOSIN O. | HND/23/SGI/FT/059 | Member |
| 4 | ADEOYE AYOBAMI L. | HND/23/SGI/FT/063 | Member |
| 5 | SHUAIB OLOHUNTOYIN | HND/23/SGI/FT/064 | Member |
| 6 | OGUNLADE MATHEW K. | HND/23/SGI/FT/065 | Member |
| 7 | AYINLA ABDULWAHAB B. | HND/22/SGI/FT/094 | Member |
| 8 | GANIYU MISTURA D. | HND/22/SGI/FT/111 | Member |

1.8 Location

The project site is part of Kwara state polytechnic Ilorin fall on geographic coordinate of Latitude: 008 33 25.96; Longitude : 004 37 54.39 to Latitude: 008 33 24.78 ; Longitude: 004 38 05.73, covered total area of 5 hec.

CHAPTER TWO

2.0 LITERATURE REVIEW

A Digital Surface Model (DSM) is a digital representation of the Earth's surface, including natural and man-made features. The creation of a Digital Surface Model (DSM) is a crucial aspect of various fields, including geography, geology, urban planning, and environmental monitoring. A DSM provides a detailed representation of the Earth's surface, allowing for the analysis of terrain characteristics, land use patterns, and environmental features. This chapter reviews the existing literature on DSM creation, focusing on the methods, techniques, and applications of DSMs.

A digital surface model represents the elevation associated with the surface of the earth including topography and all natural or human-made features located on the surface of the earth. There is a variety of DSM source data available for developed areas and the suitability of this available data is depending on the project specifications. In remote regions around the World, where little or no source data is available, the DSM can be produced automatically from stereo satellite scenes, from satellite sensors such as IKONOS, SPOT-5 and Terra-ASTER 1; topography at various resolutions, depending on the quality and scale of the aerial photography.

Digital Surface Model stands for the Earth's surface including all the objects on it, for instance, trees, plants, buildings, and other features elevated above the "Bare Earth". On the other hand, the Digital Terrain Model represents the bare ground surface without any object. An important fact that has to be taken into account in the DTM generation is the resolution attribute, the higher the resolution capture, more feasible the DTMs generation which depends on the application of complex algorithms. LiDAR is a good example of high-resolution capture, the advantages of using the LiDAR include the high density of sampling, high vertical accuracy, and the opportunity to derive these set of surface models given that some laser scanning systems can already provide at least two

versions of the surface: the vegetation canopy (first returns) and ground surface (last returns).

Digital Surface Models (DSMs) offer the possibility of extracting the elevations of surface features to leave the ground surface DEM. For many applications in the urban environment this separation of above-surface feature information from ground information can offer a useful combination of data sets. For example, detailed knowledge of the elevation of the ground surface is essential for predicting good inundation and the potential effects of sea level rise, whilst a detailed model of the man-made objects that would be affected is essential for property owners, planning authorities and insurance companies. This paper discusses several such applications and focuses on how Airborne Laser Scanning devices can provide digital surface models which can be used to separate surface features from the ground for modeling flood inundation from rivers in urban and semi-urban environments. DEMs can be constructed by digitizing existing topographic maps (Gao, 1995, 1997) or by using stereoscopic aerial photographs. With the advance of digital photogrammetry, DSMs can be created using stereo image matching techniques (Smith & Smith, 1996). Many authors (Abanmy, Khamees, Scarpace & Vonderohe, 1995; Jaafar & Priestnall, 1998) have considered the potential for these DSMs to provide the heights of surface features such as buildings. Recently LiDAR (Light Detection And Ranging) has become an established technique for deriving geometric information in three dimensions. The system is seen to offer a relatively quick technique for extracting accurate surface models and thus offers the potential for the creation of DEMs and other mapping products (Kost, Loddenkemper & Petring, 1996; Lohr, 1998).

Digital Surface Model stands for the Earth's surface including all the objects on it, for instance, trees, plants, buildings, and other features elevated above the "Bare Earth". On the other hand, the Digital Terrain Model represents the bare ground surface without any object. An important fact that has to be taken into account in the DTM generation is the resolution attribute, the higher the resolution capture, more feasible the DTMs generation which depends on the application of complex algorithms. LiDAR is a good example of high resolution capture, the advantages of using the LiDAR include the high

density of sampling, high vertical accuracy, and the opportunity to derive these set of surface models given that some laser scanning systems can already provide at least two versions of the surface: the vegetation canopy (first returns) and ground surface (last returns).

Digital Surface Models (DSMs) are often used to model the first reflective or visible surface, while DTMs typically refer to the bare earth without trees, buildings, and other natural or manmade features. DSMs and DTMs are common products derived from various sources, such as (digital) photogrammetric systems, optical satellite imagery through block adjustment, real-time kinematic GPS, topographic maps, total station surveys, and LIDAR mapping, among others. In modern map production, DSMs and DTMs serve as valuable information sources for scene analysis, change detection, GIS database updating, 3D feature extraction and reconstruction, inter-visibility calculations for optimizing telecommunication antenna locations, risk mapping, generating true ortho-images, mission planning and rehearsal, virtual and augmented reality applications, and urban planning. This definition implies that the built environment though delicate, but an integral part of the human environment has witnessed unprecedented use and re-use, hence the need for an efficient and rational action towards making it sustainable. Since resources are scarce and are fast diminishing, even as demands on them are on the increase, planning as an intelligent and rational form of decision making becomes inevitable as a means of reducing waste, of producing greatest return from the employment of resources and of ensuring efficiency in the utilization of resources to achieve maximum economic growth and national development.

However, because of the peculiar nature and importance of the built environment, planners around the world have emphasized the need to cater for physical development within the cities and other human settlement using the planning principles and concepts. The essence of this is to achieve a livable settlement described as ‘a welcoming, organized and comprehensible environment, where physical elements is unifying, accessibility within and without facilitate communication and promote interactions and flexibility, involving the design and development of buildings, circulation and

service/utility system adapt to the needs of an evolving environment' (Office of University Planning,1997). Physical development planning which is concerned with the process of ordering the use of land and siting of buildings structures and communications to secure the maximum degree of economy, functionality, convenience, and beauty (Keeble, 1969) has, therefore, come to be accepted as a major area of planning because it encompasses all other facets of human interaction with land, including building engineering, mining or other operations in, on, over or under any land.

The above statement is vividly captured in the UN Agenda 21 and Habitat Agenda summed up in the concept of urban physical sustainability defined as an intervention to enhance the livability of buildings and urban infrastructure for all city dwellers, without damaging or disrupting the urban region environment (Adriana and Nicholas, 2002).

Surveying, which is also interchangeably called geomatics, has been defined as the science, art, and technology of determining the relative positions of points above, on, or beneath the Earth's surface, or of establishing such points. In a more general sense, however, surveying can be regarded as that discipline which encompasses all methods for measuring and collecting information about the physical earth and our environment, processing that information. and disseminating a variety of resulting products to a wide range of clients (Ghilani& Wolf 2008).

Surveying has been important since the beginning of civilization. Its earliest applications were in measuring and marking boundaries of property ownership. Throughout the years its importance has steadily increased with the growing demand for a variety of maps and other spatially related types of information and the expanding need for establishing accurate line and grade to guide construction operations (Ghilani& Wolf 2008).

Topographic surveys are three-dimensional; they employ the techniques of plane surveying and other special techniques to establish both horizontal and vertical control. The relief or configuration of the terrain and the natural or artificial features are located by measurement and depicted on a flat sheet to form a topographic map. Contour lines,

connecting points of the same elevation, are used to portray elevations at any one of various intervals measured in meters or feet.

GIS technology has made topographical mapping and geo-visualization more accurate, appealing and a large area can be mapped within a far lesser time frame. It has the power to visualize geographic data by allowing the user to dynamically integrate multiple data sources, unconstrained by format, scale and coordinate system. Also, the capability of GIS technology to visualize and analyze spatial and non-spatial information from diverse sources make it a powerful platform for multilevel decision making, and so greater credit should be given to its geo-visualization capabilities. They enable a large volume of geographic data to be summarized into a map which, without doubt, facilitates fast visual interpretation (Nkeki, 2013a). In this paper, GIS technology is viewed from two dimension—the spatial data gathered with sensor-based space satellite devices used for producing topographic maps such as DEM and those used for manipulating and geo-visualizing the DEM data such as GIS software and algorithms. Geo-visualization (geographic visualization) refers to the technologies and procedures of displaying geographic data for quick visual interpretation. Presently, this method of visualizing geographic dataset is fast replacing the cumbersome paper topographical map. It is capable of visualizing multiple spatial data and presents a friendly interface between the map and the user.

3D city models are digital representations of the Earth's surface and related objects belonging to urban areas (like cities, factories, buildings etc.). Several disciplines like urban planning, architecture, telecommunication, tourism, environmental protection and many others have an increasing demand for digital 3D city models, in order to use such complex data for planning, analyses, visualization and simulation in different applications. Additionally, the open geospatial viewers (e.g. Google Earth, Virtual Earth, etc.) increase the demand on 3D city models (Remondino et al., 2006). 3D city model and its update require the development of automatic methods for acquisition of Digital Surface Models (DSM) (Toutin and Gray, 2000). Digital photogrammetry, both airborne

and spatial, is efficient modern technique for DSM acquisition as a base for 3D city modelling.

A digital surface model represents the elevation associated with the surface of the earth including topography and all natural or human-made features located on the surface of the earth. There is a variety of DSM source data available for developed areas and the suitability of this available data is depending on the project specifications. In remote regions around the World, where little or no source data is available, the DSM can be produced automatically from stereo satellite scenes, from satellite sensors such as IKONOS, SPOT-5 and Terra-ASTER 1; tography at various resolutions, depending on the quality and scale of the aerial photography.

2.1 Methods for DSM Creation

Several methods can be employed to create DSMs, including:

1. Ground Surveying: Traditional ground surveying methods, such as Total Station and leveling, can be used to collect data for DSM creation. These methods provide accurate measurements of terrain features and are suitable for small-scale projects(Kahmen & Faig, 2012).
2. Remote Sensing: Remote sensing technologies, including photogrammetry and LiDAR (Light Detection and Ranging), have become increasingly popular for DSM creation due to their ability to collect data over large areas. LiDAR technology uses laser pulses to measure distances and create detailed 3D models of the terrain(Wehr & Lohr, 1999).
3. Interferometric Synthetic Aperture Radar (InSAR): InSAR is a technique that uses radar images to generate DSMs, particularly useful for areas with persistent cloud cover or dense vegetation. InSAR can provide accurate measurements of terrain

deformation and is widely used in geological and environmental applications (Hanssen, 2001).

2.2 Techniques for DSM Generation

Various techniques can be applied to generate DSMs from collected data, including:

1. **Triangulation:** Triangulation methods, such as Triangulated Irregular Network (TIN), can be used to create DSMs from irregularly spaced data points. TIN is a popular method for generating DSMs from LiDAR data (Peucker et al., 1978).
2. **Grid-based Methods:** Grid-based methods, such as Inverse Distance Weighting (IDW) and Kriging, can be employed to generate DSMs from regularly spaced data points. IDW is a simple and efficient method, while Kriging is a more complex method that takes into account the spatial autocorrelation of the data (Burrough & McDonnell, 1998).

2.3 Applications of DSMs

DSMs have a wide range of applications, including:

1. **Urban Planning:** DSMs can be used to analyze urban morphology, identify areas of high population density, and plan infrastructure development. DSMs can also be used to simulate the impact of urban development on the environment (Barnsley & Barr, 1997).
2. **Environmental Monitoring:** DSMs can be employed to monitor land use changes, track deforestation, and analyze terrain characteristics. DSMs can also be used to study the impacts of climate change on the environment (Kourgialas & Karatzas, 2017).

3. **Natural Hazard Assessment:** DSMs can be used to assess the risk of natural hazards, such as landslides and floods, by analyzing terrain characteristics and land use patterns. DSMs can also be used to identify areas prone to erosion and sedimentation (Guzzetti et al., 2006).

2.4 Advantages and Limitations of DSMs

DSMs have several advantages, including:

1. **Detailed Representation:** DSMs provide a detailed representation of the Earth's surface, allowing for accurate analysis and decision-making.
2. **Flexibility:** DSMs can be used in various fields and applications, from urban planning to environmental monitoring.
3. **Cost-Effective:** DSMs can be generated using a range of methods, including remote sensing and ground surveying, making them a cost-effective solution for many applications.

However, DSMs also have some limitations, including:

1. **Data Quality:** The quality of the DSM depends on the quality of the input data, which can be affected by various factors, such as sensor accuracy and data resolution.
2. **Data Complexity:** DSMs can be complex and require significant computational resources to process and analyze.
3. **Interpretation:** DSMs require careful interpretation and analysis to extract meaningful information and insights.

2.5 Project Review

In conclusion, DSMs are a powerful tool for understanding the Earth's surface and have a wide range of applications in various fields. The choice of method and technique for DSM creation depends on the specific application and data availability. DSMs provide

a detailed representation of the terrain and can be used to analyze terrain characteristics, land use patterns, and environmental features.

CHAPTER THREE

3.0 METHODOLOGY

3.1 PROJECT PLANNING

Before beginning any survey assignment, project planning is a crucial requirement. It entails a careful investigation of the topic matter about a certain land region that is being evaluated. This crucial step in the surveying process allows the surveyor to become acquainted with the chosen location before starting work. During the reconnaissance phase, the survey's goals, requirements, and required precision levels are examined because these elements have a big impact on the choice of survey tools and techniques. In the end, this project resulted in the development of a first working diagram. Reconnaissance is divided into two phases: (i) Office Planning and (ii) Field reconnaissance.

3.1.1 FIELD RECONNAISSANCE

As part of this process, a surveyor or student must physically visit the site to gain a thorough understanding of its topography, including any vegetation, accessibility, existing frame work, as well as the social and economic 19 activities that take place there. The optimal approach and tools for improved decision-making must also be chosen. This on-site visit gives the surveyor or student a comprehensive grasp of the entire region and allows them to look at the entire area of the land. To guarantee correct orientation, the locations of all accessible horizontal and vertical controls in the region of the research area will be visited, and their outlooks will be viewed. This exercise makes it easier to create a Recce diagram, which is shown below but is not drawn to scale:

Figure 1.4: RECCI DIAGRAM

3.1.2 OFFICE PLANNING

Gathering crucial project information is the focus of this phase, which is usually done in an office setting. It is the initial phase of planning that comes before the fieldwork itself and entails gathering and analyzing a variety of project-related data. This covers a range of requirements for the project, scheduling, budgeting, and generating the coordinates for the control points under the project control prefix. It includes figuring out the best process, picking the right tools, as well as subscription for the CORS station.

3.2 EQUIPMENT USED/ SYSTEM SELECTION SOFTWARE

The following equipment was used:

- i. Total station and accessories
- ii. One Tripod
- iii. Two Prism
- iv. One 7.5 meters short tape
- v. One Plumb bob
- vi. One Cutlass
- vii. Bottle corks and nails
- viii. Writing materials.

3.2.1 HARDWARE USED

| | |
|-----------------------|---|
| Model: | HP 15 Note book PC |
| System Manufacturer: | Hewlett-Packard |
| Rating: | 1.0 Windows Experience Index. |
| Processor: | Intel(R) Core(TM) i5-3230M CPU @ 2.60GHz, 2601 Mhz, 2 Core(s), 4 Logical Processor(s) |
| Installed Memory RAM: | 8.00 GB |
| System Type: | x64-based PC. |

Product ID: F9F84EA#ABV

3.2.2 SOFTWARE USED

Some of the software used includes:

- i. AutoCAD 2007
- ii. Notepad
- iii. Microsoft Word 2007
- iv. Microsoft Excel 2007
- v. Arc GIS 10.5

3.3 DATA ACQUISITION

This involves using different surveying methods and tools to gather data and make observations in the field. To acquire data for this project, Handed GPS and Total station were both used.

3.3.1 PRIMARY DATA SOURCE: This is a type of data source in which data is direct acquired from the field such as data acquired from field survey operations.

3.3.2 SECONDARY DATA SOURCE: This data source are already made data or gotten from research work, which has been acquired for future use. This involves downloading satellite imagery used for the project area and Google map as guide.

3.4 TEST OF INSTRUMENT

Testing of instruments is very crucial when carrying out any survey operation. Having collected the required instruments from the department, the check was carried out on the accuracy and precision of both the Handed GPS and TOTAL STATION to ensure they were in proper working condition before the actual field observation of the project.

3.4.1 TEST FOR TOTAL STATION

The horizontal collimation and vertical index inaccuracies of the instrument were confirmed. Once the device was positioned on a rather flat surface, the required temporary modifications, including focusing, centering, and setting, were made. Configuration information, such as extra parameters and fast settings, was examined and adjusted as necessary. The configuration

parameters selected collimation, namely horizontal collimation. Next, to focus on a distant object, the means' option located on the left side of the device was chosen. The instrument was transited, and the right side went through the same procedure. Then, when the 'accept' button was pushed, the table that was displayed showed the old and new values for the vertical index errors and horizontal collimation. Re-press "ok" signified acceptance of the updated values, which were minimal.

The diagrammatic representation of the procedure and the readings obtained are shown below

Table 3.4.1 COLLIMATION TEST OF TOTAL STATION

| ST N | SIGH T | FACE | HCR | REDUCTION | VCR | REDUCTION |
|---------|-----------|------|-----|-----------|-----|-----------|
| | | | | | | |

| | | | | | | |
|---|---|---|-----------------|--------------|-------------|---------------|
| A | B | L | 126° 07' 11.33" | | 67° 22' 40" | |
| | B | R | 306° 07' 31.3" | 180° 00' 20" | 292° 37' 1" | 359 ° 59' 41" |

HORIZONTAL COLLIMATION ERROR = $180^{\circ}00'20'' - 180^{\circ}$

= $00^{\circ}00'20''$

= $00^{\circ}00'20''/2 = 00^{\circ}00'10''$

VERTICAL INDEX ERROR = $360^{\circ} - 359^{\circ}59'41.6''$

= $00^{\circ}00'18.4''$

= $00^{\circ}00'18''/2 = 00^{\circ}00'9.2''$

The instrument's satisfactory operation was validated by the acceptance of the updated readings. It appears from this result that any possible issues can be resolved or at least greatly reduced.

3.4.2 REFERENCING AND ORIENTATION OF TOTAL STATION

Tripod Setup:

- Place the tripod over the station point (known or assumed).
- Level the tripod head as much as possible by adjusting the legs.

Mount the Total Station:

- Fix the total station onto the tripod head.
- Ensure it's securely locked in place.

Centering and Leveling:

- Use the optical plummet or laser plummet to center the instrument exactly over the survey station mark (station point).
- Level the instrument using the foot screws and circular bubble.
- Fine-tune leveling using the electronic level display.

Power On and Instrument Configuration

- Switch on the Total Station.
- Set the correct project, coordinate system, and units.
- Select the appropriate survey mode (e.g., topographic survey or station setup).

Orientation (Station Setup)

Orientation means establishing the direction of the horizontal angle reference (back sight direction).

Orientation by Known Coordinates (Resection or Free Station)

Used when both the instrument station and a back sight point have known coordinates.

1. Input the coordinates of the instrument station (or let the instrument compute it later).
2. Sight and measure to one or more known reference points (minimum of 2 for better accuracy).
3. The Total Station calculates the instrument position and orientation using these known points.

3.3.7 PERIMETER TRAVERSING

The perimeter of the project area was traversed for the purpose of the coordinating the boundary points. HandedGPS (GALAXY G1) was connected to kwara state CORS station for referencing and orientation after which all the boundary points were traversed using HandedGPS from the initial until each successive boundary is occupied.

3.3.8 DETAILING

All features such as roads, buildings, electric poles, street light, trees, etc. were captured by coordinating their edges simultaneously as the perimeter is being measured within the project area. Buildings were measured and identifiers (BD) were used to differentiate them from other features. Roads were also measured and labelled (RD) accordingly. Data captured here were basically in 3Dimension i.e. Easting, Nothings and Elevations (X, Y, and Z) coordinates.

3.3.9 REMOTE ELEVATION MEASUREMENT

All the features such as buildings, electric poles, street light, etc. captured by coordinating their edges from a subsidiary traverse stations created within the project area.

Buildings heights were measured and recorded. Electric poles height were also measured and recorded accordingly. So also the same was repeated for the trees. Data captured here were basically in 3Dimension i.e. Easting, Nothings and Elevations + Heights (X, Y and Z + H) coordinates. The following procedures were followed:

- i. Escape key was pressed then F1 for MENU
- ii. The REM programme was selected.
- iii. Observation was made again and the height of reflector was displayed.
- iv. The telescope was tilted to the top of the object and the height keeps changing until F4 is been pressed to stop.
- v. The value was recorded.

Figure 3.3.9: REM OBSERVATION STRATEGY

3.3.9A SPOT HEIGHTINGS

This was carried out by occupying randomly the subsidiary points within the project area and taking measurements (Easting, Nothings and Heights) along the terrain at approximate intervals to determine the difference in height between points and some areas within the project location. Spot heighten is very important in producing topographical information of the area with the aid of ArcGIS 10.5.

3.4 PHYSICAL DESIGN

At this stage, all geospatial (attribute) data were structured and organized to form a database in a format acceptable by the implementing software and hardware. This was done in a way that, stored information can be accessed and retrieved at any time. Also, for regular updates when the need arise and to allow for analytical functions to be carried out answering generic questions. Also, it provided integrity and security that must be obeyed before such data could be accepted into the records. These virtues are as show in the tables below. ArcGIS 10.5 was used for database creation of the project area.

Table 3.4A TREE TABLE

| ATTRIBUTE | DATA TYPE | WIDTH | DECIMAL |
|-----------|-----------|-------|---------|
| T_ID | String | 5 | - |
| T_NAME | Float | 20 | - |
| EASTING | Number | 10 | 3 |
| NORTHING | Number | 10 | 3 |
| T_USE | Float | 10 | - |
| T_HEGHT | Number | 7 | 3 |

Table 3.4B ROAD TABLE

| ATTRIBUTE | DATA TYPE | WIDTH | DECIMAL |
|-----------|-----------|-------|---------|

| NORTHING | Number | 10 | 3 |
| EASTING | Number | 10 | 3 |
| RD_HEIGHT | Number | 7 | 3 |

Table 3.4C ELECTRIC POLE TABLE

| ATTRIBUTE NAME | DESCRIPTION OF ATTRIBUTE | DATA TYPE | WIDTH | DECIMAL |
|----------------|-----------------------------|-----------|-------|---------|
| POINT_ID | Electric pole identifier | Number | 6 | - |
| NORTHING | Coordinate | Number | 15 | 3 |
| EASTING | Coordinate | Number | 15 | 3 |
| EP_TYPE | Type of Electric pole | Text | 15 | - |
| EP_HEIGHT | Height of the Electric pole | Number | 5 | 2 |

Table 3.4D BUILDING TABLE

| ATTRIBUTE | DATA TYPE | WIDTH | DECIMAL |
|------------------|------------------|--------------|----------------|
| P_ID | String | 15 | - |
| NAME | Text | 15 | - |
| CONDITION | Text | 15 | - |
| USE | Text | 15 | - |
| HEIGHT | Number | 15 | 2 |
| AREA_METERS | Number | 15 | 2 |

Table 3.4E STREETLIGHT TABLE

| ATTRIBUTE NAME | DESCRIPTION OF ATTRIBUTE | DATA TYPE | WIDT H | DECIMA L |
|---------------------------|---|----------------------|-------------------|---------------------|
| POINT_ID | Street light identifier | Number | 6 | - |
| NORTHING | Coordinate | Number | 15 | 3 |
| EASTING | Coordinate | Number | 15 | 3 |
| SL_HEIGHT | Height of the street light | Number | 5 | 2 |

3.5 DATABASE CREATION

Database is an organized integrated collection of data stored so as to be capable of use by relevant application with data being accessed by different logical part. This was the construction phase where database was created. After the table has being populated via the keyboard, some attributes such as area, perimeters of parcel were automatically displayed by special command in the ArcGIS 10.5 version.

Figure 3.5: ABSTRACTED OF TABLE CREATED

3.5.1 ATTRIBUTE DATA ACQUISITION

The data about the characteristics of features especially man-made features were acquired through oral interview method and online source (Google Earth). Social survey was carried out during which information such as; building name, building use and related data about features were obtained from the students and staffs within the school. All these data formed the attribute aspect of the feature necessary for the database creation.

3.6 DATA PROCESSING

3.6.1 TOTAL STATION DATA DOWNLOADING PROCEDURE

Data downloading is the process of transferring data from the instrument into the computer system connected through the connection cable or wireless such as Bluetooth with the help of software in the computer, the process is as follows as performed on Total station.

- Connection of the two devices (computer and the instrument).
- Go to project working folder created on the instrument.
- Click on export.
- Input the name of file

- v. Indicate the file extension for the output
- vi. Permit the other device to receive the file.

3.6.2 DRAFTING AND PLOTTING

The script file created containing the refined coordinates was then opened in the AutoCAD environment and the boundary of the project area was plotted using AutoCAD 2007. This was followed by the details, which included buildings, roads, trees, sport facilities and electric poles.

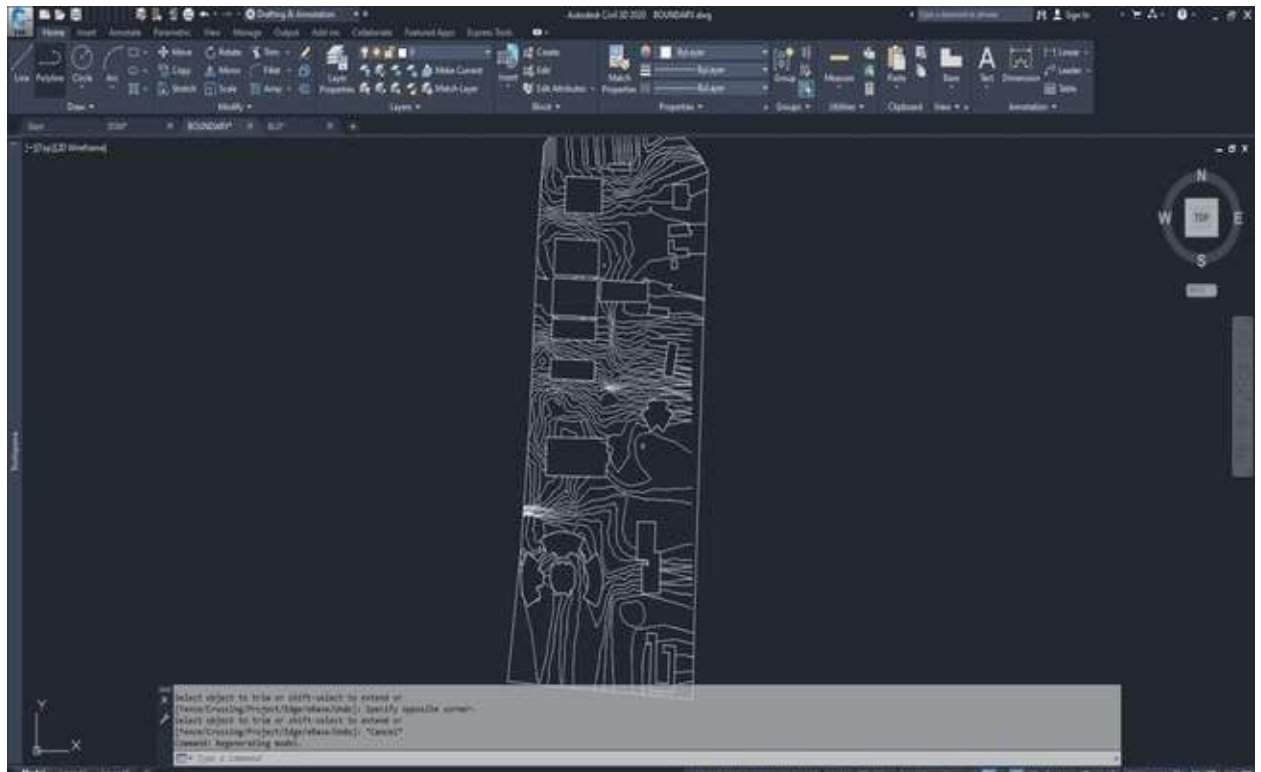

Figure 3.6.2: AUTOCAD PLOTTING.

3.7 DATABASE MANAGEMENT

3.7.1 DATA SECURITY

This is the security measure used the protection of the database security is very important since it is vital for data integrity. The strategic measure used included controlling access to database by use of password.

3.7.2 DATA INTEGRITY

This ensures that data in the database is accurate and that cases of violation of integrity can be detected automatically by the system. Here, care was taken while entering data into the system, such that, accurate data were entered and updating could be done accurately without tampering with existing data. Backups are provided to cater for any loss of data through system failure. Also a member of the project group was appointed for quality assurance and checks therefor do checks the consistency, accuracy and integrity of the input data.

3.8.3 DATABASE MAINTANANCE

Having created the database, proper maintenance practice was made to meet its stated objectives. The ability to include more data and remove irrelevant data can be possible. There is every need for the data to be updated regularly because of the physical changes that tends to occur on the landscape with time, even as a result of development.

Both security and integrity were also exercised to ensure maintenance and to meet its stated objectives.

CHAPTER FOUR

4.0 SPATIAL ANALYSIS AND INFORMATION PRESENTATION

4.1 TESTING OF DATABASE

This is the test carried out to determine whether the relationship between the spatial data of a feature and their attributes is capable of being retrieved. This is necessary to ascertain the quality of data in the database, its reliability to satisfy the demand of the user. The spatial data were arranged logically in an organized manner with respect to their attributes. This was carried out by designing a sample query and running the query to see if the desired result would be achieved. In this project, the database was queried to show different categories of information levels in the project area. Hence the database was confirmed fit for analysis. A sample of the attribute table in the database design can be found on the next page.

The screenshot displays a GIS application window with a 'Table' view showing a list of points and their attributes. The table has columns for FID, Shape, NAME, LAYER, and ELEVATION. The data includes points with various IDs and names, all categorized as 'Unknown Point Feature'. The 'ELEVATION' column shows values ranging from 361.042 to 362.406. To the right, a 'Catalog' window shows a tree structure of project files, including folders like 'HND_PROJECT MATERIAL' and 'ASPECT', and files like 'ALOS_NEW', 'Islamoyat_PRO_material', and 'New_road'.

| FID | Shape | NAME | LAYER | ELEVATION |
|-----|-------|-------|-----------------------|-----------|
| 188 | Point | P1161 | Unknown Point Feature | 361.042 |
| 190 | Point | P1162 | Unknown Point Feature | 361.064 |
| 191 | Point | P1163 | Unknown Point Feature | 361.175 |
| 192 | Point | P1164 | Unknown Point Feature | 361.799 |
| 193 | Point | P1165 | Unknown Point Feature | 361.894 |
| 194 | Point | P1166 | Unknown Point Feature | 361.43 |
| 195 | Point | P1167 | Unknown Point Feature | 362.129 |
| 196 | Point | P1168 | Unknown Point Feature | 362.192 |
| 197 | Point | P1169 | Unknown Point Feature | 362.416 |
| 198 | Point | P1170 | Unknown Point Feature | 362.72 |
| 199 | Point | P1171 | Unknown Point Feature | 362.337 |
| 200 | Point | P1172 | Unknown Point Feature | 362.177 |
| 201 | Point | P1173 | Unknown Point Feature | 362.1 |
| 202 | Point | P1174 | Unknown Point Feature | 362.004 |
| 203 | Point | P1175 | Unknown Point Feature | 361.916 |
| 204 | Point | P1176 | Unknown Point Feature | 362.192 |
| 205 | Point | P1177 | Unknown Point Feature | 362.134 |
| 206 | Point | P1178 | Unknown Point Feature | 362.024 |
| 207 | Point | P1179 | Unknown Point Feature | 361.97 |
| 208 | Point | P1180 | Unknown Point Feature | 362.343 |
| 209 | Point | P1181 | Unknown Point Feature | 362.36 |
| 210 | Point | P1182 | Unknown Point Feature | 362.471 |
| 211 | Point | P1183 | Unknown Point Feature | 362.432 |
| 212 | Point | P1184 | Unknown Point Feature | 362.244 |
| 213 | Point | P1185 | Unknown Point Feature | 362.176 |
| 214 | Point | P1186 | Unknown Point Feature | 362.277 |
| 215 | Point | P1187 | Unknown Point Feature | 362.406 |
| 216 | Point | P1188 | Unknown Point Feature | 362.194 |

Figure 2.1: SAMPLE OF ATTRIBUTE TABLE

4.2 SPATIAL QUERY

Queries were designed for the purpose of retrieving information from the database. The queries performed in this project gave answers to certain generic questions asked from the database. This was made possible as a result of the implicit link of both the spatial and attributes data. The queries were based on the products from the analysis carried out on the database.

4.2.1 SINGLE CRITERIA QUERY

A single criterion is carried out where one condition is used to design query. This condition is used to retrieve the information from the database.

QUERY ANALYSIS 1 (selection by attribute)

ANALYSIS ONE

Analysis Name: Database extraction

Analysis Type: Single criteria analysis

Syntax: Query analyses showing buildings that are used for Administrative.

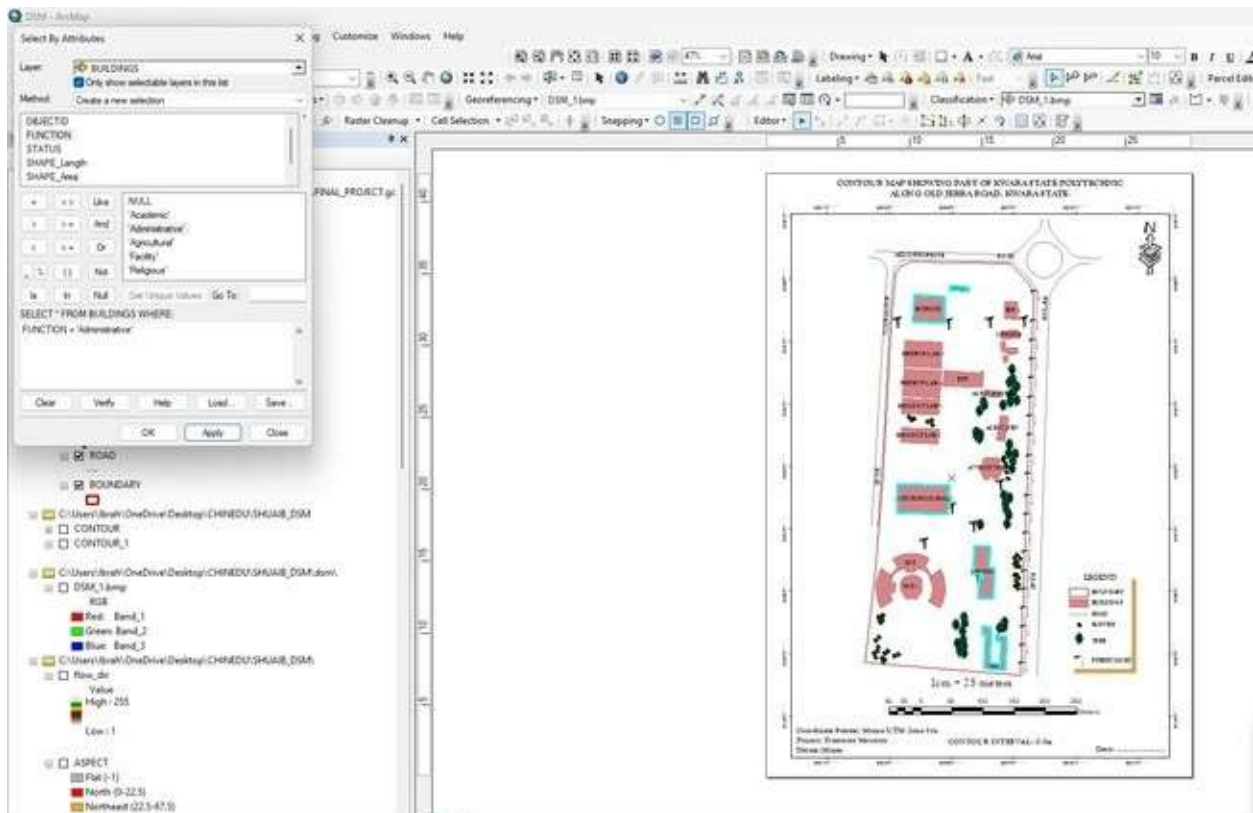

Figure 4.2.1.1 RESULT OF QUERY: (BLD_FUNCTION = “ADMINISTRATIVE”).

Analysis Name: Database extraction

Analysis Type: Single criteria analysis

Syntax: “BLD_Function” =”Agricultural”

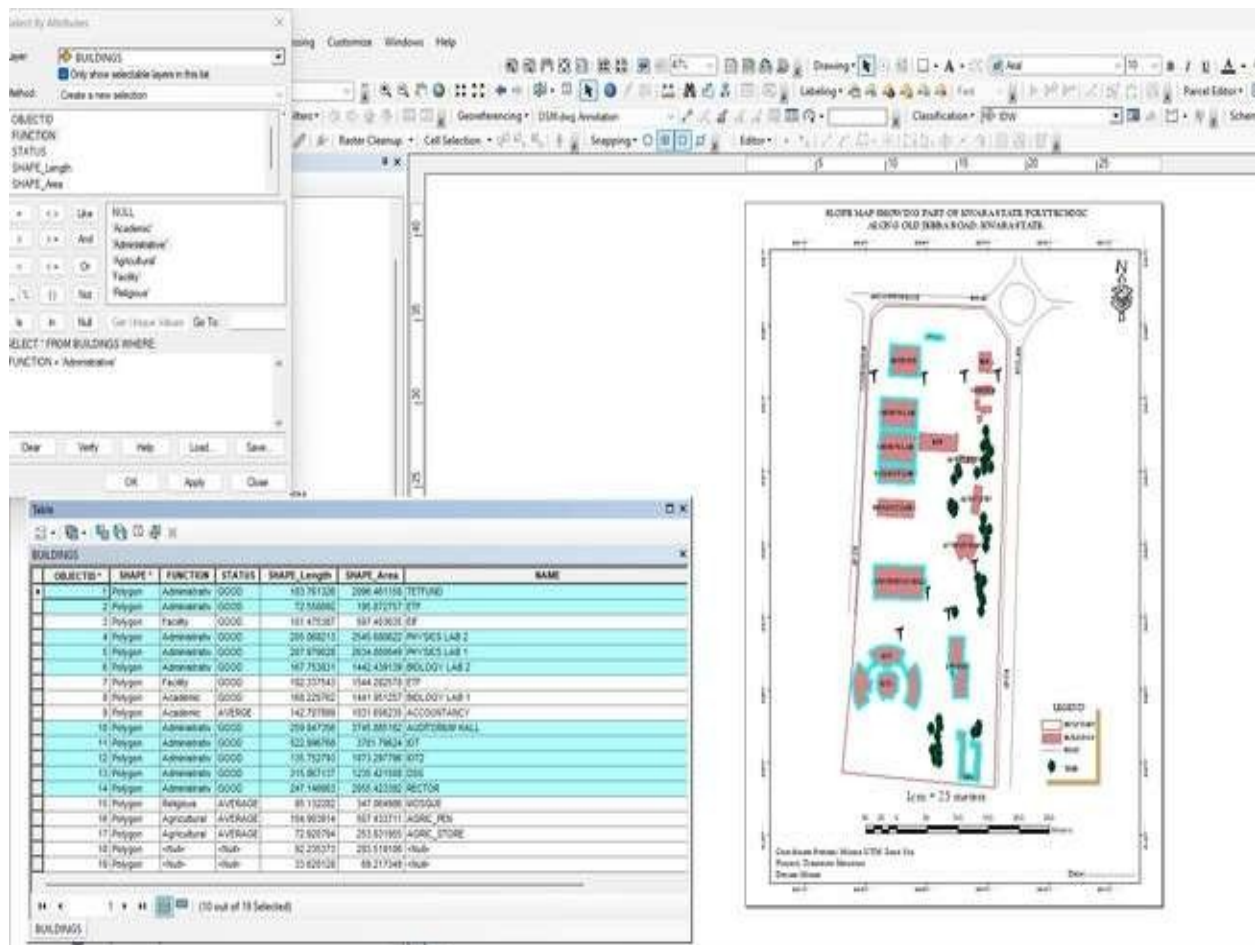

Figure 4.2.1.3: QUERY BLD_FUNCTION"ACADEMIC"

ANALYSIS FOUR

Analysis Name: Database extraction

Analysis Type: Single criteria analysis

Syntax: "TREE_FUNCTION= ORNAMENT"

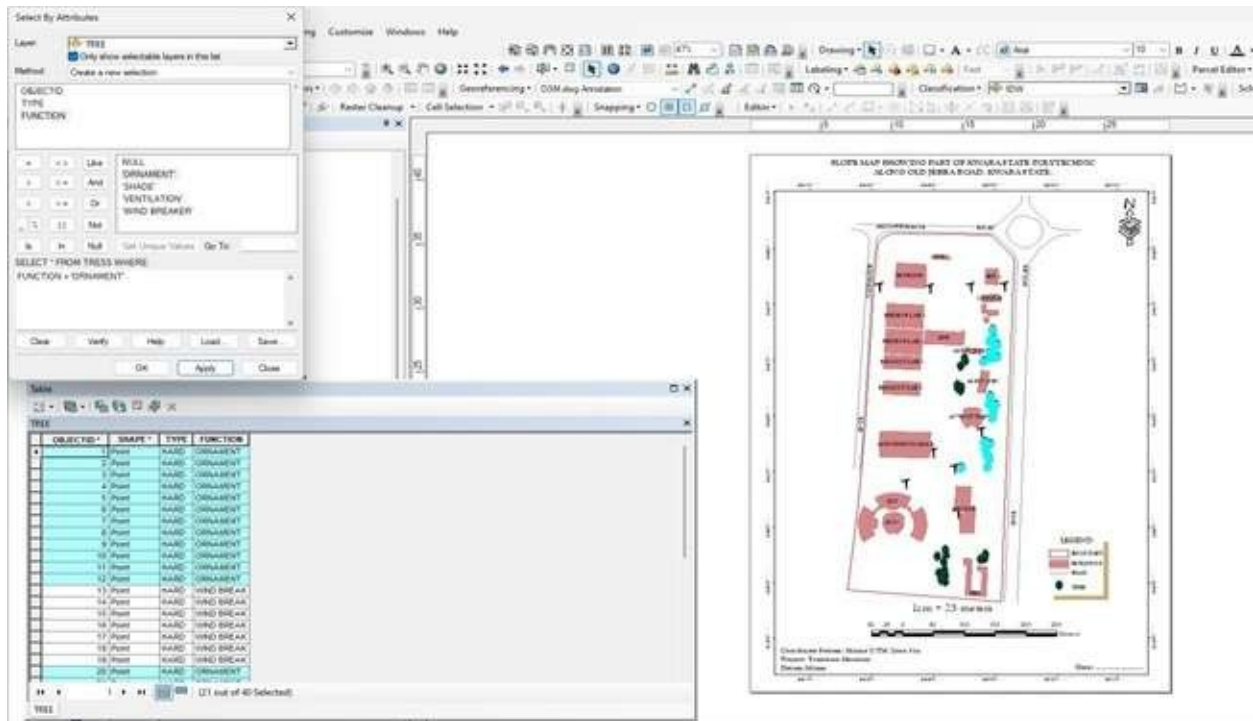

Figure 4.2.1.4: RESULT OF QUERY: (TREE_FUNCTION “ORNAMENT”).

4.2.2 MULTIPLE CRITERIA

This is a situation where two or more conditions are used to design a query. The conditions determine the information that may be requested by the user from the database.

Query for QUERY: TREE_FUNCTION “ORNAMENT” AND TREE_TYPE “HARD”

ANALYSIS FOUR

Analysis Name: Database extraction

Analysis Type: Multiple criteria analysis

ANALYSIS FOUR

Analysis Name: Database extraction

Analysis Type: Multiple criteria analysis

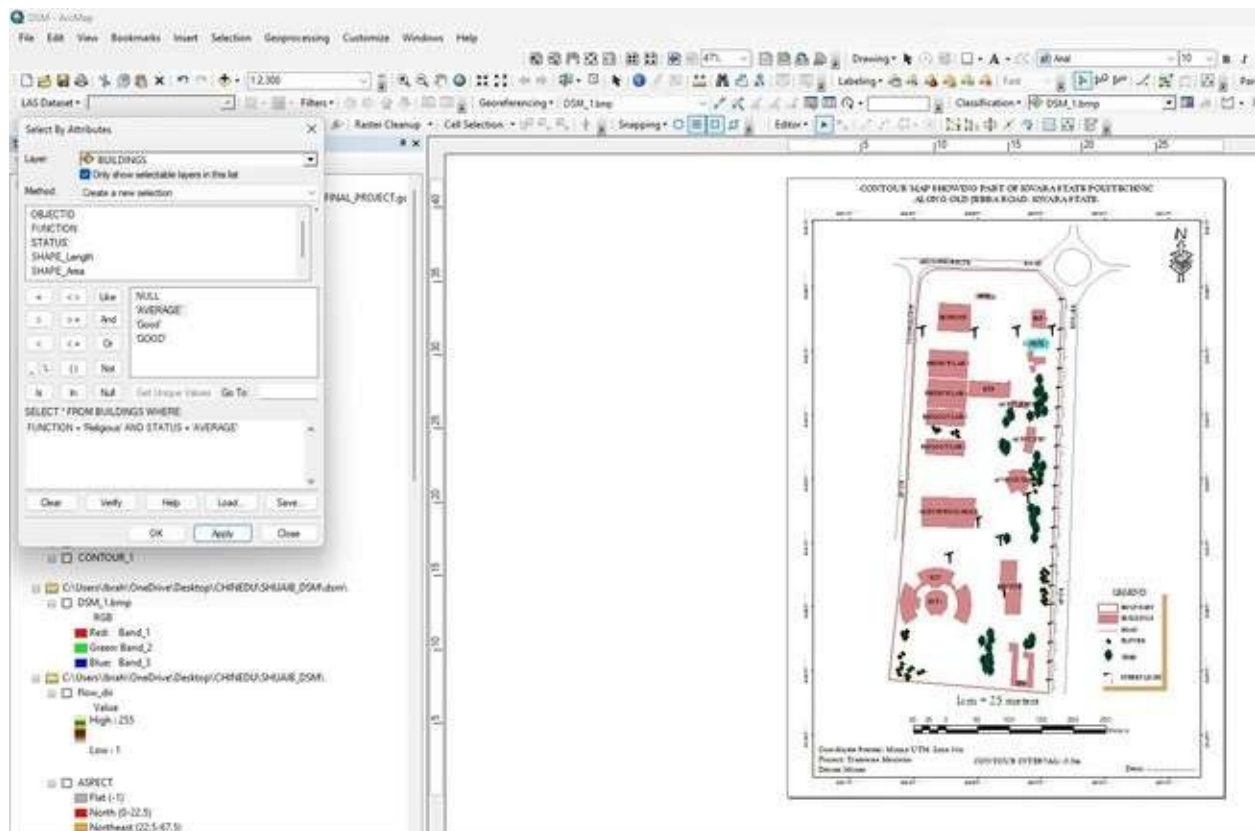

Figure 4.2.2.2 RESULT OF QUERY: BLD_FUNCTION =“RELIGIOUS” AND BLD_STATUS= “AVERAGE”

4.2 SPATIAL ANALYSIS

This makes Geographic Information System (GIS) a unique analytical tool or technique because of its ability to combine spatial attribute data to produce information relevant for decision making. The basic GIS analysis performed in this project includes overlay and topographic operations. Maps on various themes were overlaid since they were from the same geometric origin.

4.2.1 OVERLAY OPERATION

This overlay operation is the presentation that shows different features within the project area. The outcome of overlay operation could be composite plan if it shows all the existing features, and boundary.

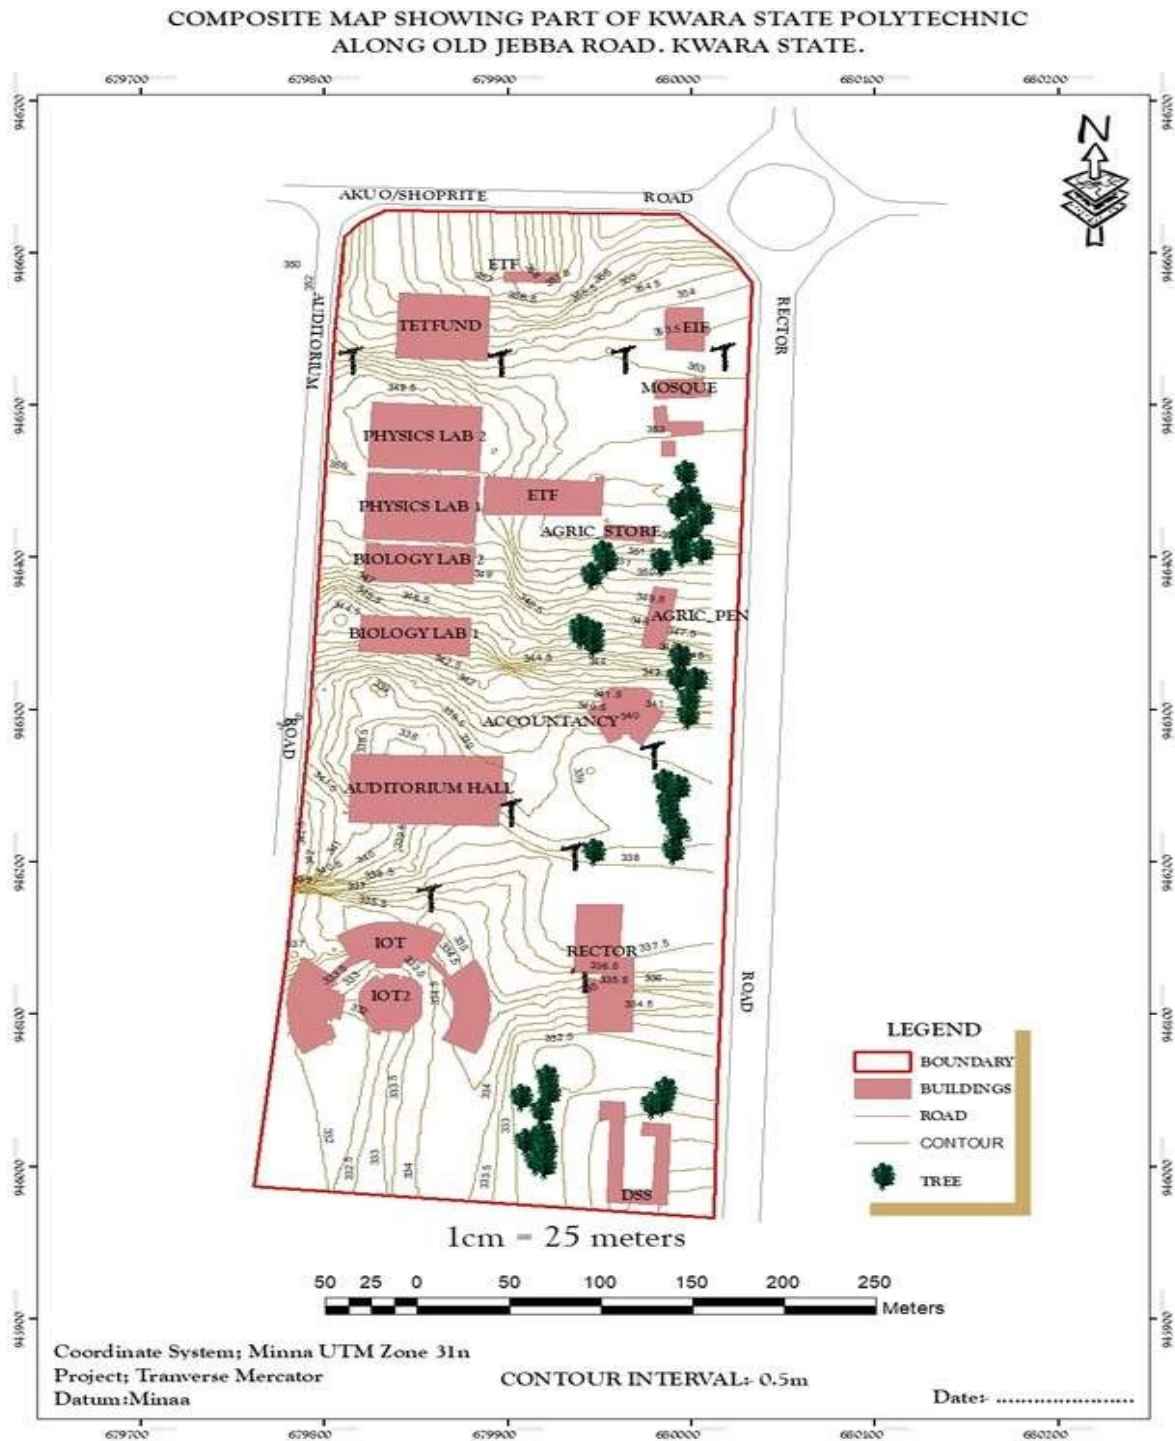

Figure 4.2.1: COMPOSITE MAP OF THE PROJECT AREA.

4.2.2 TOPOGRAPHICAL OPERATIONS

Topographic operations were carried out to determine the surface characteristic of the area which showed the relief of the project. These operations were performed on the Digital Elevation Model (DEM) generated from the use of relevant software, in this case, ArcGIS 10.5 and ArcScene 10.5 was used. The following maps were produced from the topographic operations and analysis:

- i. **TRIANGULATION IRREGULAR NETWORK (TIN):** this shows series of triangulated surface automatically generated from ArcGIS 10.5 using 3D analysis tools. This is applicable in finding suitable place for building or any engineering construction

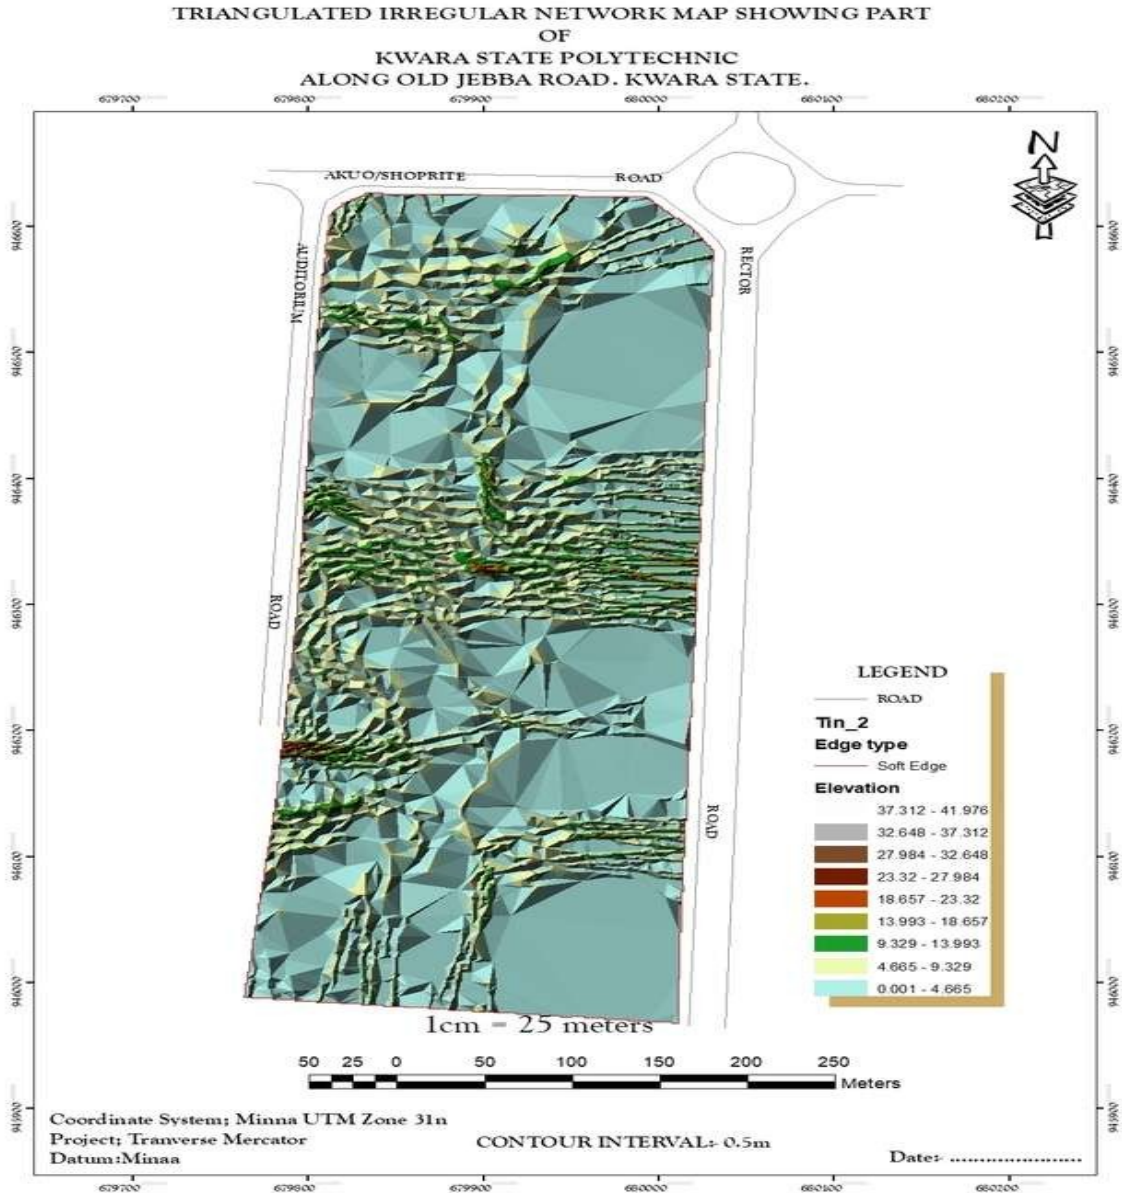

Figure 4.2.2.1: TIN AND DETAILS OVERLAY MAP OF THE PROJECT AREA

- ii. **SLOPE MAP:** A slope map represents the gradient or steepness of the terrain's surface. It calculates the rate of change in elevation between neighboring pixels or points on a digital elevation model (DEM). Typically, slope is measured in degrees or percentage. Steeper slopes are represented by higher values, while flatter areas have lower values.

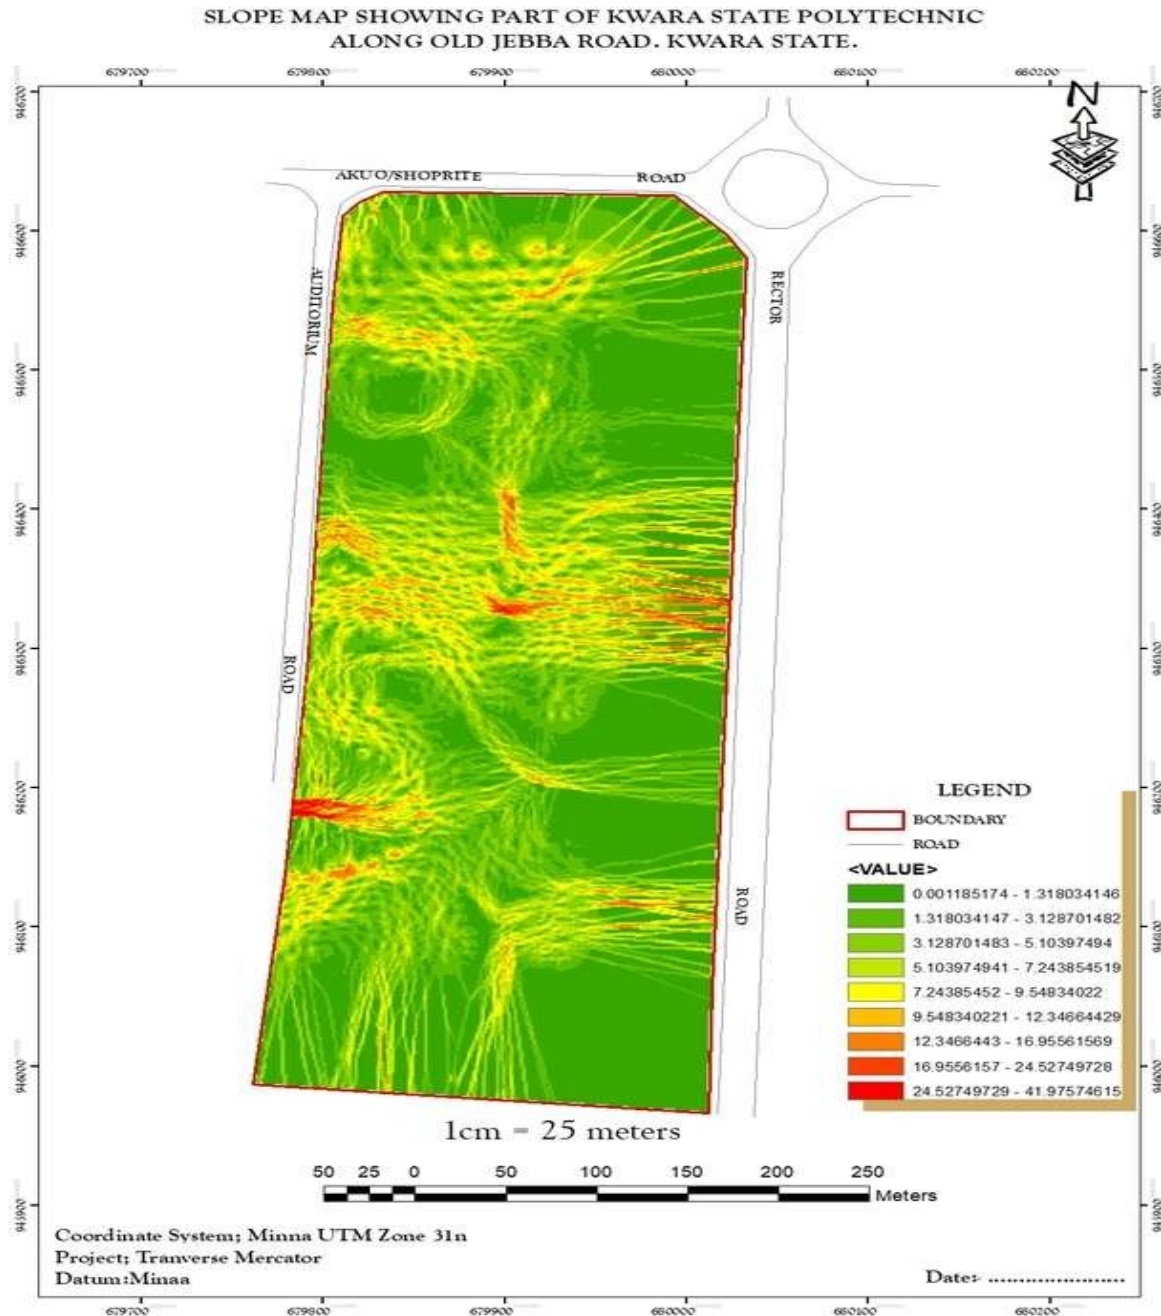

Figure 4.2.2.2: SLOPE MAP OF THE PROJECT AREA

iii. THE ASPECT MAP:

This shows the direction of the surface faces. It is used to determine how much sun a hill received and the information can be used to put building where they will get enough sun. Also

the aspect map shows the suitable place for plane landing i.e. the flat terrain area and also solar illumination which can affect the diversity of life i.e. Vegetation and soil studies; glaciology.

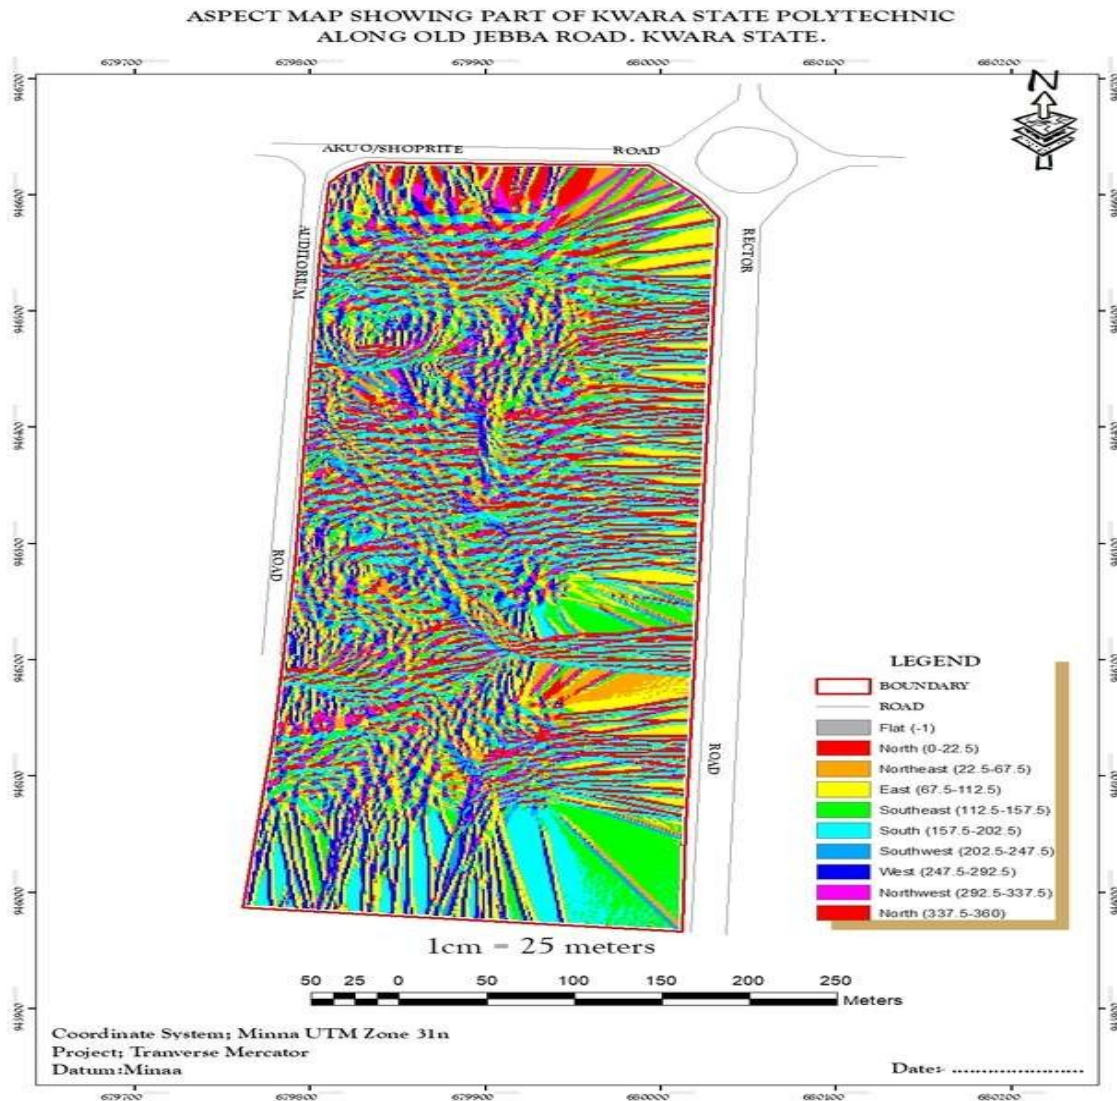

Figure 4.2.2.3: ASPECT MAP OF THE PROJECT AREA.

iv. THE CONTOUR MAP:

Contour maps display lines connecting points of equal elevation on the terrain surface. These lines, called contour lines, depict the shape and elevation of the land. Contour maps are widely used in topographic mapping and land surveying for visualizing elevation changes and terrain features. This provides a very intuitive view of the landscape. Contour map of the project area

can aid in giving information on the highest and the lowest point on the terrain. This is important in road construction and location of other facilities like storage tanks for water distribution.

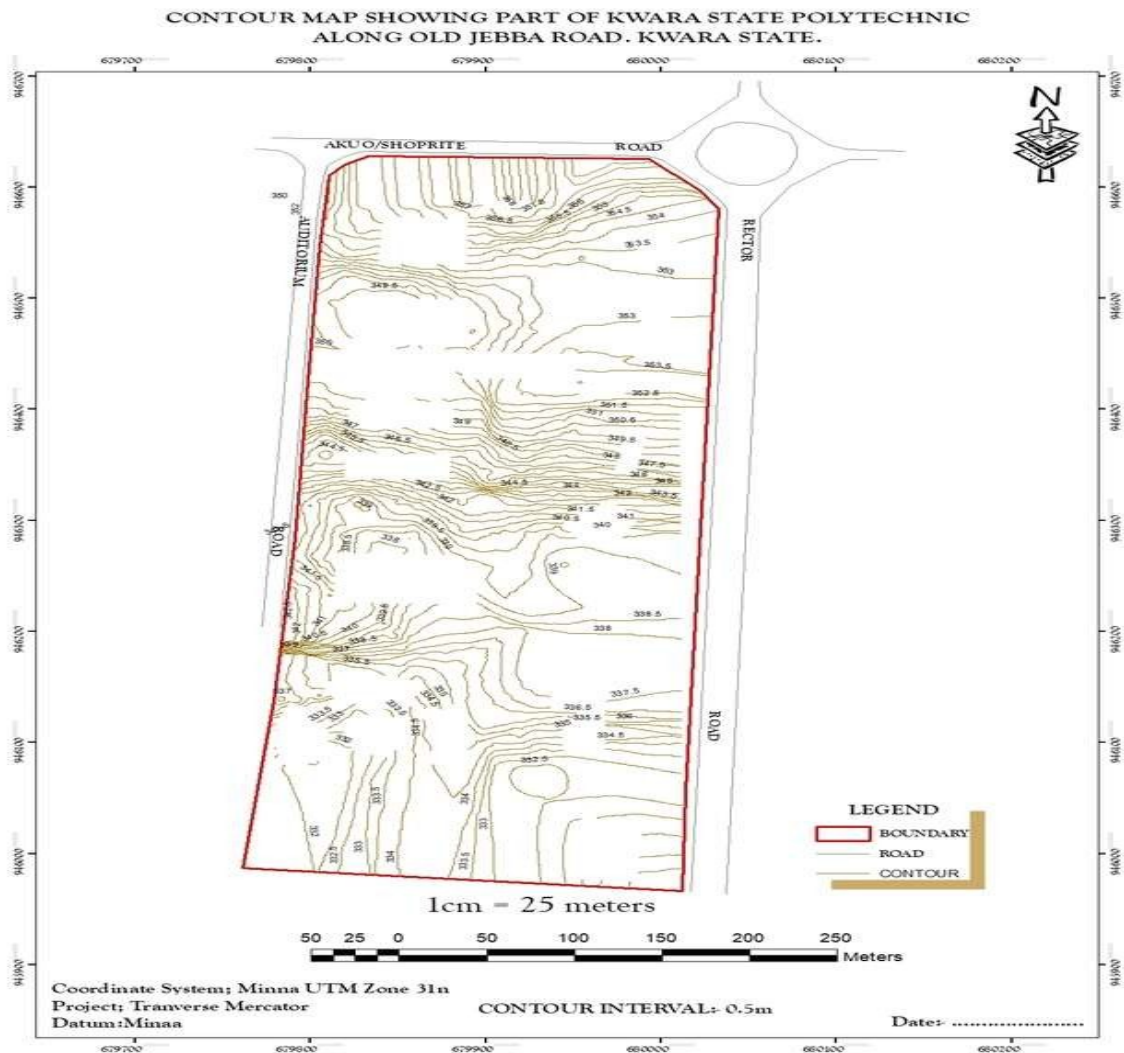

Figure 4.2.2.4: CONTOUR MAP OF THE PROJECT AREA.

v. FLOW DIRECTION MAP:

This is used to determine the direction of flow of water within the project area. It also indicates the magnitude and erosive force water passing through an area.

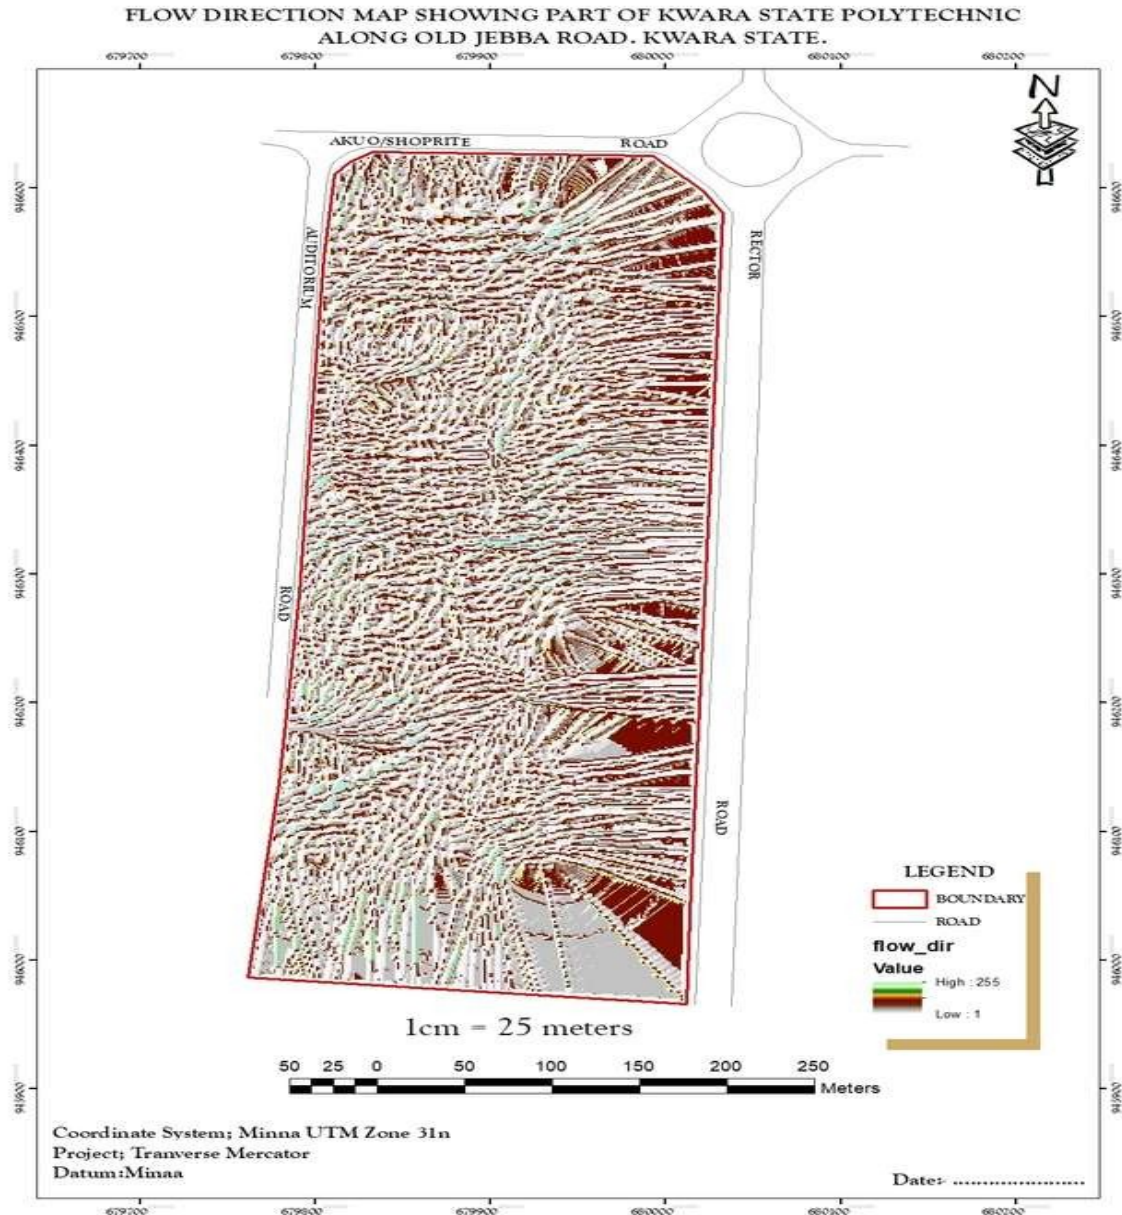

Figure 4.2.2.5 FLOW_DIRECTION MAP OF THE PROJECT AREA

vi. DIGITAL SURFACE MODEL MAP:

A DSM (Digital Surface Model) map, or Digital Surface Model, represents the elevation of the Earth's surface including all objects on it, such as buildings, vegetation, and other structures. Unlike a DTM (Digital Terrain Model), which only includes the bare-earth surface, a DSM incorporates both natural and man-made features. DSMs are useful for various applications, including urban planning, infrastructure design, and 3D visualization. They are often derived

from aerial or satellite imagery, LiDAR data, or photogrammetry techniques. This shows the reality of the terrain of the project area.

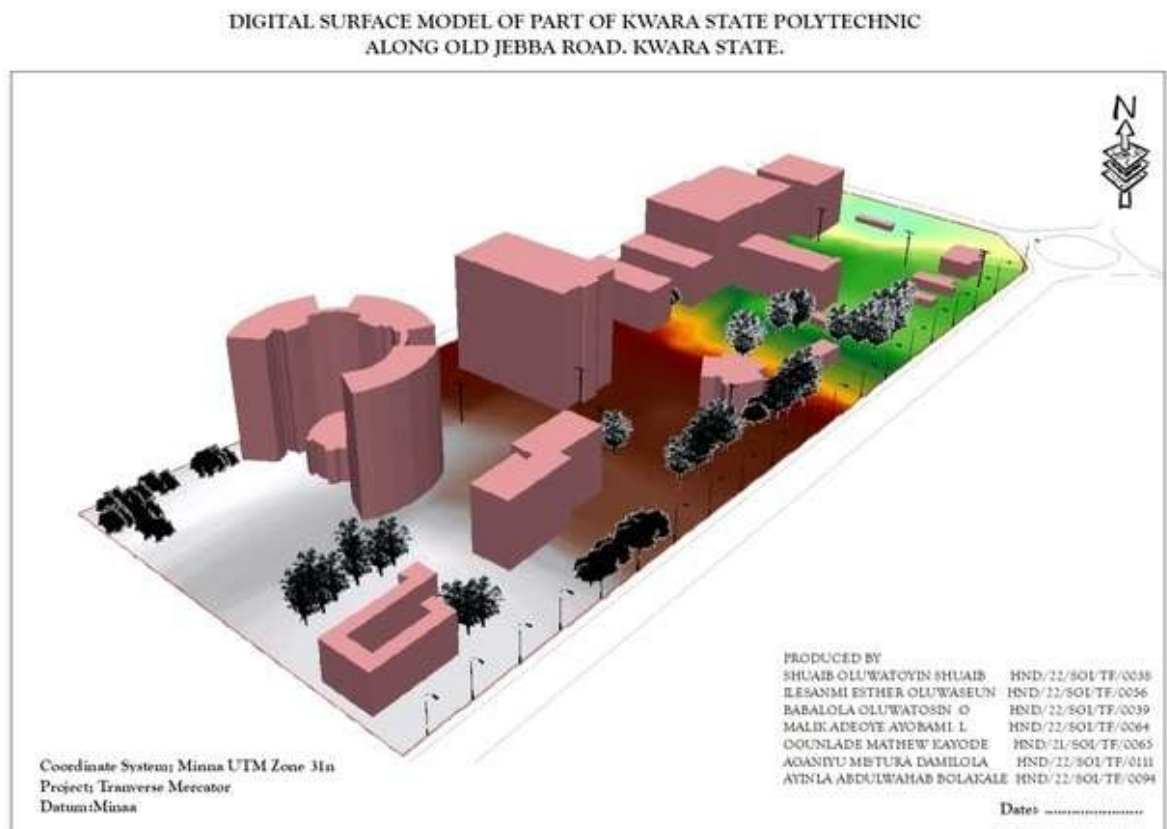

Figure 4.2.2.6: DIGITAL SURFACE MAP OF THE PROJECT AREA

4.3 RESULT ANALYSIS

From the below pie chart, it is inferred that large percentage is serving academic function. The DSM project commenced with the utilization of a Total station referenced to control station within kwara state polytechnic to capture 3D data of the project area. The captured data were then processed using software, employing photogrammetry techniques to generate a high-precision DSM and create a detailed 3D model. Subsequently, ArcGIS and ArcScene software was employed to visualize and analyze the DSM data, facilitating spatial analysis and information presentation both in 2D and 3D respectively.

Figure 4.2.2.7: LAND USE PIE CHART

4.4 APPLICATION OF PROJECT

- i. Generally DSM is applicable in urban development modeling.
- ii. It enhanced visualization and communication of such data not only in maps modeling but also in mobile digital devices for quick navigation and assessment.
- iii. To create a sustainable and favourable living environment.
- iv. Positioning and monitoring of physical features, structures and engineering works on, above or below the surface of the earth to protect properties or investment.
- v. The feasibility studies through the use of line of sight analysis provide visibility between two points. This is good for network distribution in telecommunication.
- vi. The profile graph is good road construction which will provide the cross section of the topography from which rivers, streams and depression can be shown. Points require bridges, culverts and filling can be known from the profile graph.
- vii. The vector map shows the direction of rivers, streams and depression which helps in road construction.

- viii. The aspect map shows the direction of the surface faces. It is used to determine how much sun a hill received and the information can be used to put building where they will get enough sun also used to find where different crop will do best and also the Converging/diverging flow; soil water properties.
- ix. The aspect map shows the suitable place for plane landing i.e. the flat terrain area and also solar illumination which can affect the diversity of life i.e. Vegetation and soil studies; glaciology.
- x. The result from the analysis can be help in managing the land resources of the project area. With the DSM, adequate information has been provided for proper decision making on the school land. Proper allocation various land use can now be done without difficulty in the decision making process.
- xi. The slope map which is used to find low- slope for potential construction site and high slope that may be vulnerable to erosion or landslide.
- xii. Also, the slope map shows slope length which is important topographical parameters for soil erosion analysis and traditional soil erosion studied
- xiii. Contour map of the project area can aid in giving information on the highest point on the terrain as well as the lowest. This is important in Road construction and location of other facilities like storage tank for water distribution.

CHAPTER FIVE

5.0 PROJECT COSTING, SUMMARY, PROBLEM ENCOUNTERED, POSSIBLE SOLUTION, RECOMMENDATION AND CONCLUSION

5.1 PROJECT COSTING

Table 5.1: Shows the worked out cost of the project

| PREPARATION | RATE/DAY | NO. OF DAYS | UNIT COST(N) | AMOUNT (N) |
|---|----------|-------------|--------------|----------------|
| RECONNAISSANCE | | | | |
| DAYS | | | | |
| Senior Surveyor | 10,000 | 1 | 10,000 | 10,000 |
| Technical Officer | 5,000 | 1 | 40,000 | 40,000 |
| Skilled Labour | 5,000 | 1 | 5,000 | 5,000 |
| Transportation | 20,000 | 1 | 20,000 | 20,000 |

TECHNICAL REPORT

| ITEM | RATE/DAY | NO. OF DAYS | UNIT COST(N) | AMOUNT (N) |
|------------------|----------|-------------|--------------|----------------|
| Chief Surveyor | 30,000 | 1 | 30,000 | 30,000 |
| Surveyors | 20,000 | 1 | 20,000 × 2 | 40,000 |
| SUB TOTAL | | | | ₦70,000 |

PROJECT COST SUMMARY

COST BREAKDOWN TABLE

| ITEM | DESCRIPTION | AMOUNT (₦) |
|-----------------------------|---------------------------|-----------------|
| SUM OF THE PROJECT | Base Project Cost | ₦678,000 |
| MOBILIZATION/DEMobilIZATION | (10% of the project) | ₦67,600 |
| CONTINGENCY | (5% of the project) | ₦33,800 |
| V.A.T | (7.5% of the project) | ₦50,700 |
| ACCOMMODATION | (1.5% of the project) | ₦10,140 |
| GRAND TOTAL | Final Project Cost | ₦838,240 |

5.2 SUMMARY

To accurately determine the shape, size, and precise location of the site extensive office planning and on-site visitation were conducted. As part of the preparation process, a reconnaissance diagram was produced, providing valuable insights for informed decision-making.

Controls were searched for and checked using a South Total Station instrument, enabling the systematic traversal and observation of various points, including detailed features such as roads. The observed coordinates were diligently recorded in the field book and also saved in the memory of the total station for future reference.

The recorded coordinates were utilized to plot the boundary points and preparation of other necessary plans with accuracy. This information served as the foundation for creating a comprehensive plan and generating a detailed report, both of which were diligently prepared and printed.

5.3 Problem Encountered

1. Limited Access to Equipment: Limited access to Total Station equipment and other surveying instruments, which delayed data collection.

2. Technical Issues: Technical problems with software and equipment, such as data import errors.
3. Data Quality Issues: Ensuring data accuracy and quality, particularly with limited experience in data collection and processing.
4. Time Management: Managing time effectively to complete the project within the given timeframe, balancing data collection, processing, and analysis.
5. Software Challenges: Difficulty in using DSM software, for us with limited experience in geospatial analysis.

5.4 Possible Solution

Addressing the challenges encountered required careful planning, collaboration with supervisor, seeking assistance from geospatial analysis experts, and leveraging available resources effectively. By overcoming these challenges, the project was able to be carried out successfully and able to gain valuable skills in DMS and geospatial analysis.

5.5 RECOMMENDATION

During the course of carrying out this project a lot of new things were learned which will make me recommend that this type of project should be carried out as practical as well for the student to have a profound knowledge on it. A better learning environment with digital equipment should be available for the students as well.

5.6 CONCLUSION

In conclusion, all necessary observational procedures and precaution were taken into consideration during the project execution. The field work was carried out in line with fundamental principles of surveying and instructions from the supervisor the aim of the project which was to produce a 3D plan, perimeter and detailed plan, 3D wireframe and Contour plan was perfectly and timely achieved in better accuracies.
